

- Main activity view. Open the app and you are presented with your saved lists. Overflow menu to select store. Perhaps (forgot it in the mockup) overflow menu on each list to select copy, share, or delete, or do this through a long press. Lists are saved in local storage, and saved automatically, as in our untitled list in picture. Press add button to create a new list, or press on a list to open said list and edit or use it.

- Fragment that appears when you open or create a list. Items added to the list are sorted by aisle. Checkbox to mark items that the user has already picked up. Add button opens up the search fragment. Consider adding in some sort of ability for notes for things such as weights and amounts.

- Search fragment, searches items from a local database, sqlite for ease of use with android. Standard searching for the most part. Items are organized alphabetically. Hit add button to add item to list. Long press to get the option to add items to favourites. Favourite items appear at the top of the custom suggestions when entering a word, above items that are a more direct alphabetical match.
